Interim Progress Report for
ONR Grant No. N00014-95-1-0834

Advanced Signal Processing Techniques
for Wireless Communications

for the period

June 1, 1996 through November 30, 1996

Principal Investigator: Prof. Gregory W. Wornell

Research Laboratory of Electronics
Massachusetts Institute of Technology
Cambridge, MA 02139-4307

Efficient solutions fundamental problems of wireless communication continued to be explored during this period. This has included our work on developing promising new and bandwidth-efficient classes of time, frequency, and space diversity strategies for single- and multi-user wireless communication in multipath fading environments. A particular focus during this reporting period has been on techniques for exploiting transmitter antenna arrays to combat the effects of fading in wireless systems, and some exciting new results have been obtained. The full set of results for this period are described in detail in the following publications.

1. G. W. Wornell and M. D. Trott, "Efficient Signal Processing Techniques for Exploiting Transmit Antenna Diversity on Fading Channels," to appear in *IEEE Trans. Signal Processing*, Special Issue on Signal Processing Advances in Communications, Jan. 1997.
